

Delay Discounting: Gam Analysis

Best Model Fit

- Null, Linear, and Gam models were tested to determine best fit.
- ANOVA and F test revealed GAM model to be the best model fit.
- $p < .00001$

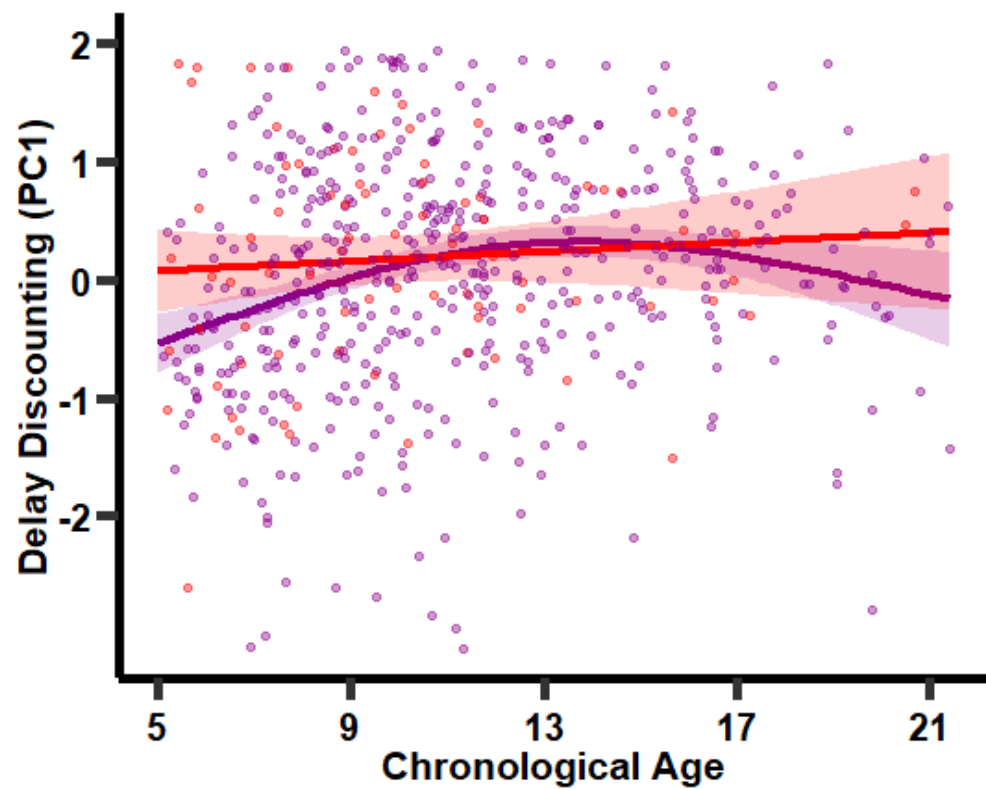

ADHD Combined

ADHD Inattentive

Anxiety

Group

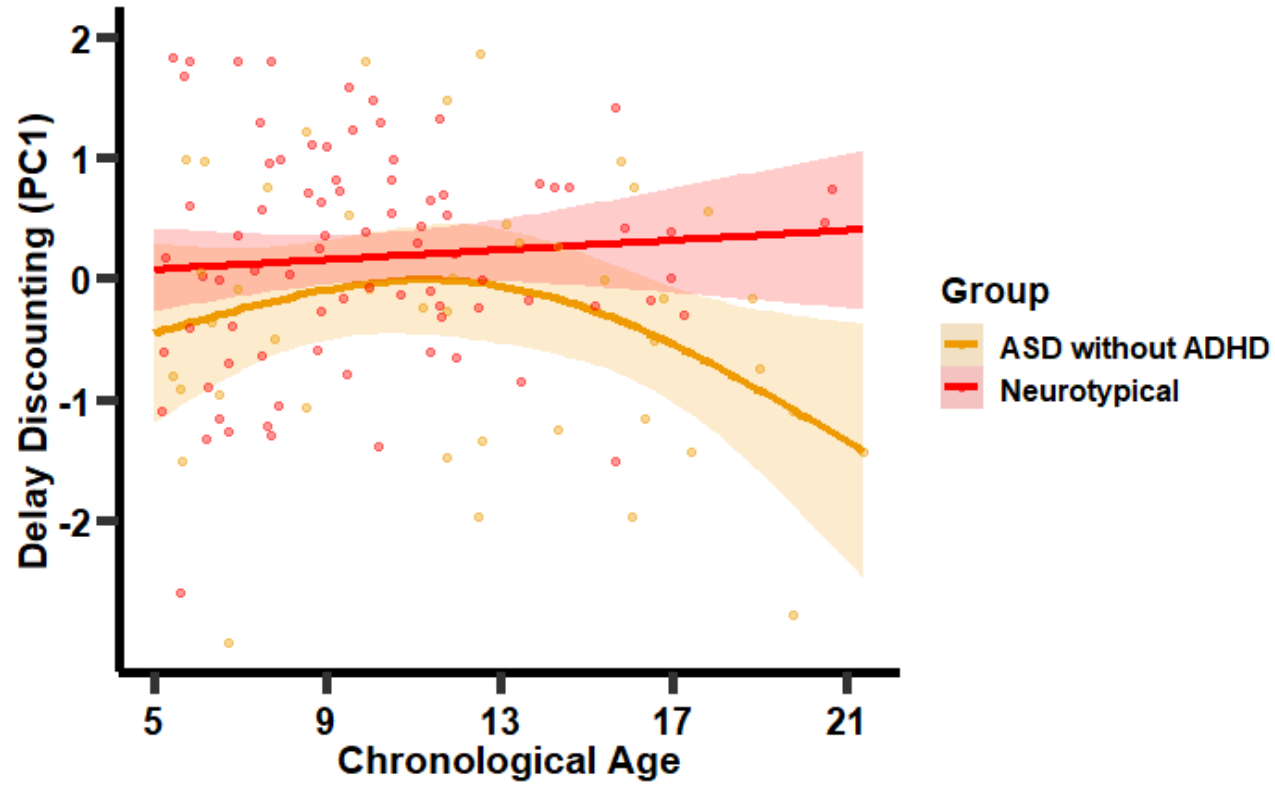

- Anxiety
- Neurotypical

Depression

Autism Without ADHD

Autism with ADHD

Learning Disorders

Diagnosis Sex Differences vs Neurotypicals

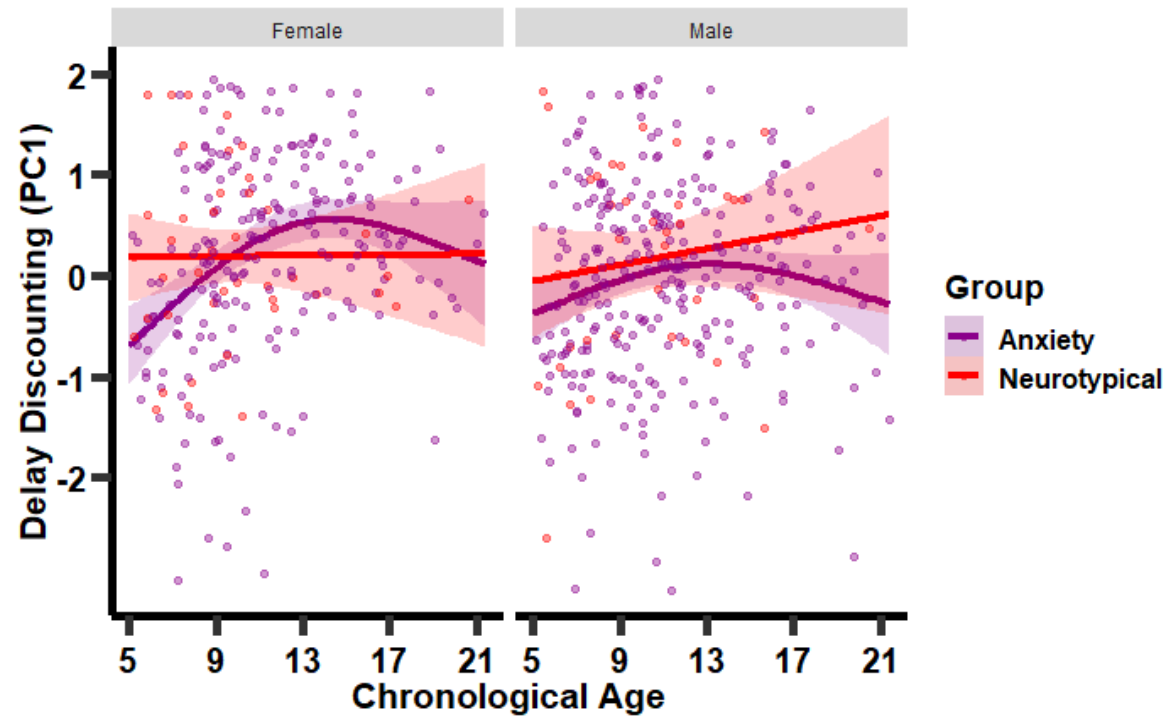

ADHD Combined - Females

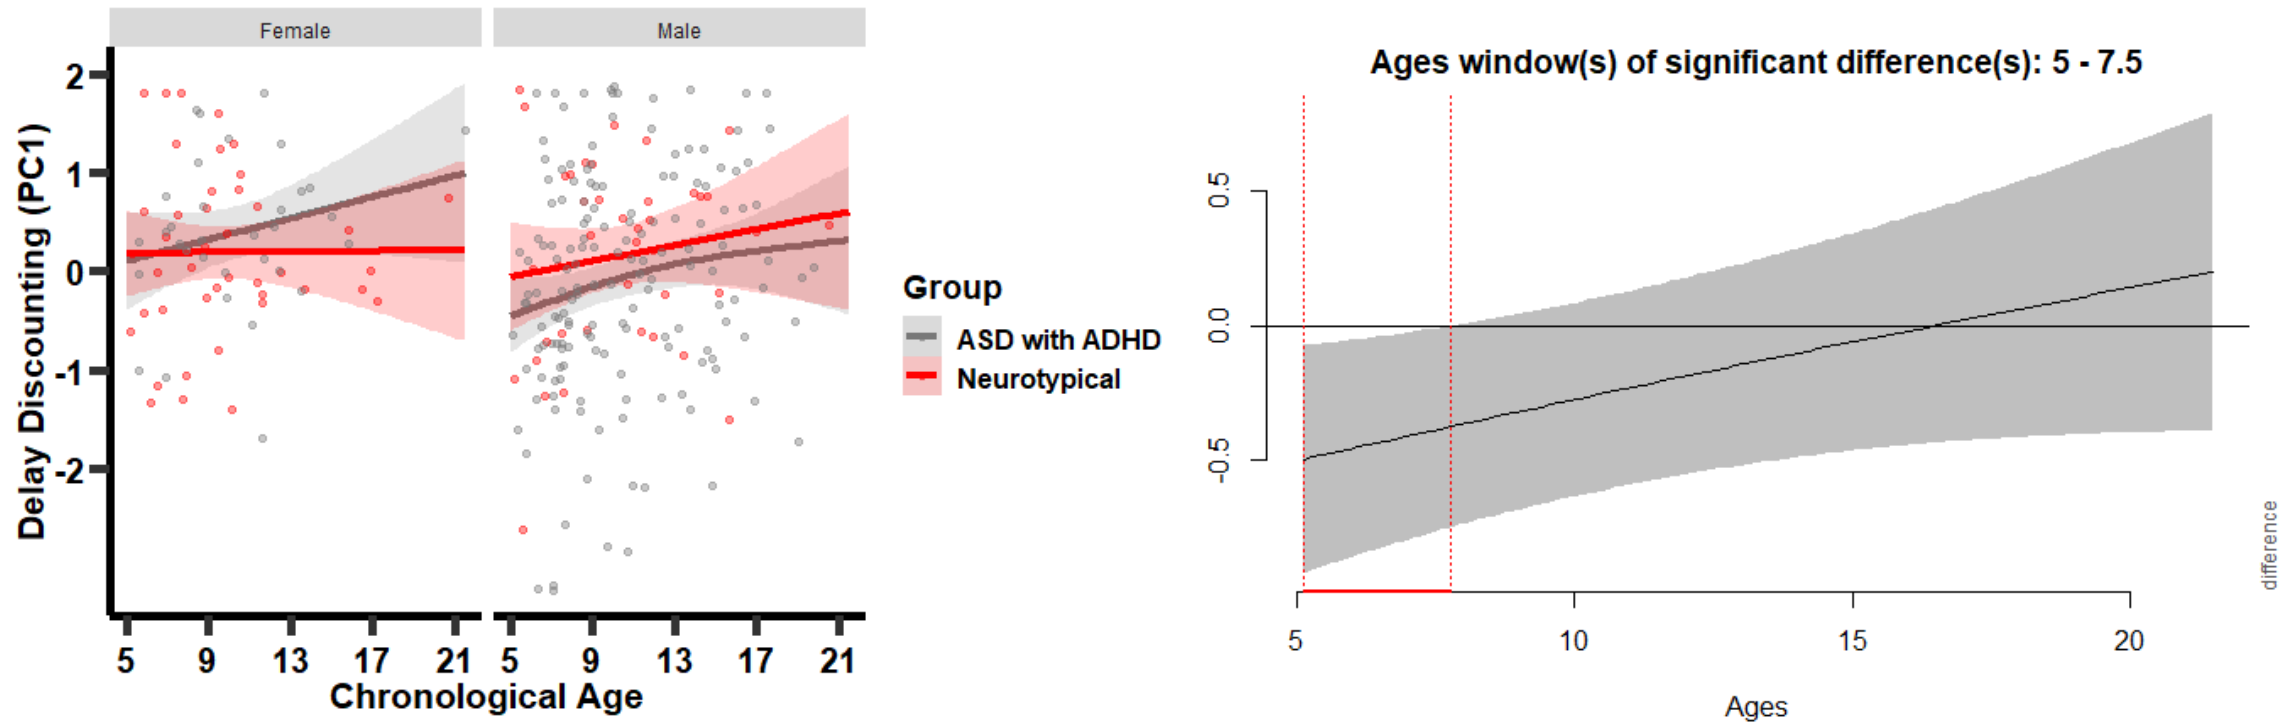

ADHD Inattentive - Female

Anxiety - Females

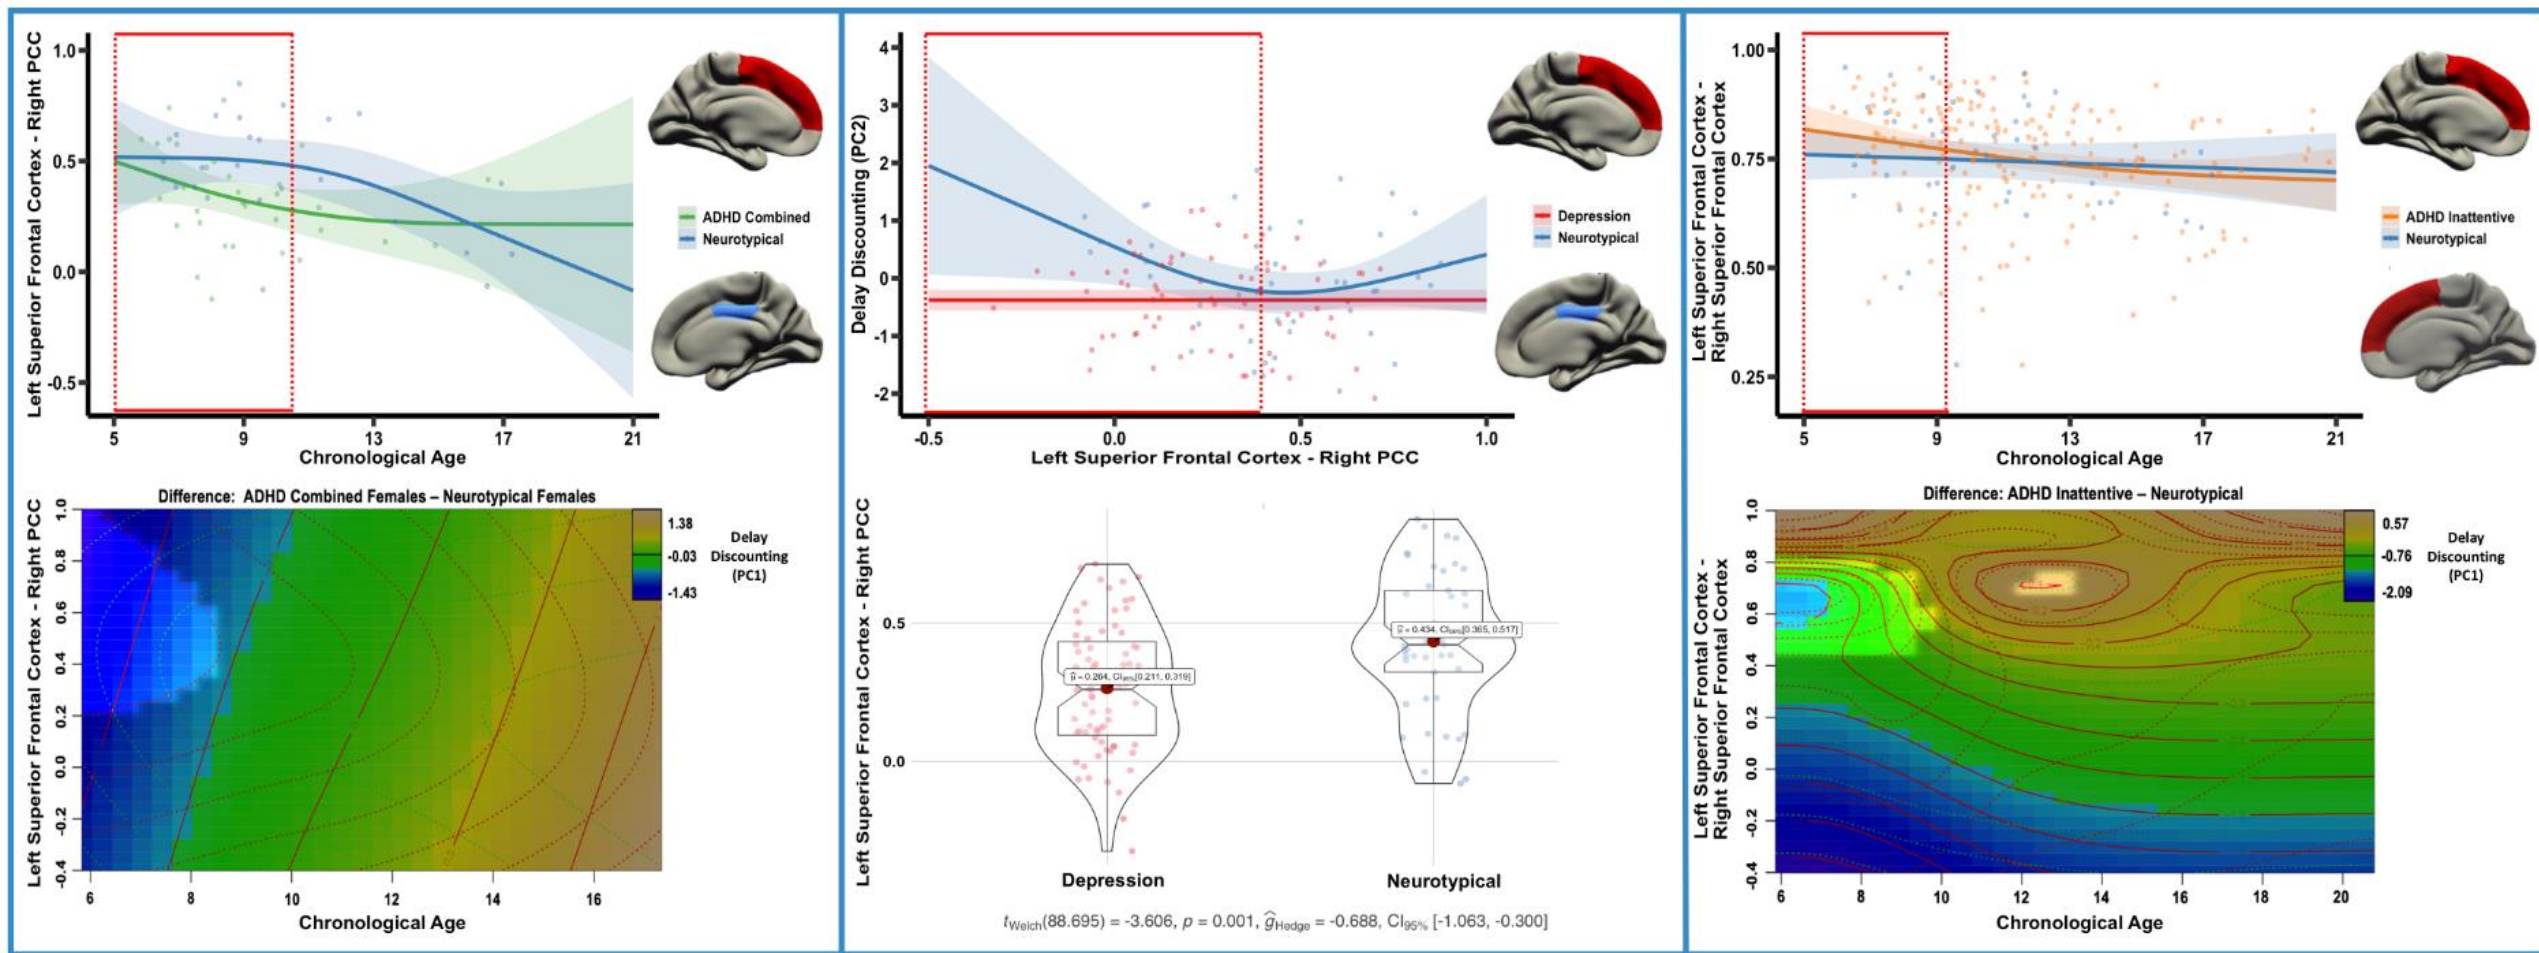

Autism With ADHD - Males

Learning Disorder – Male

Functional Connectivity Results

Subtypes

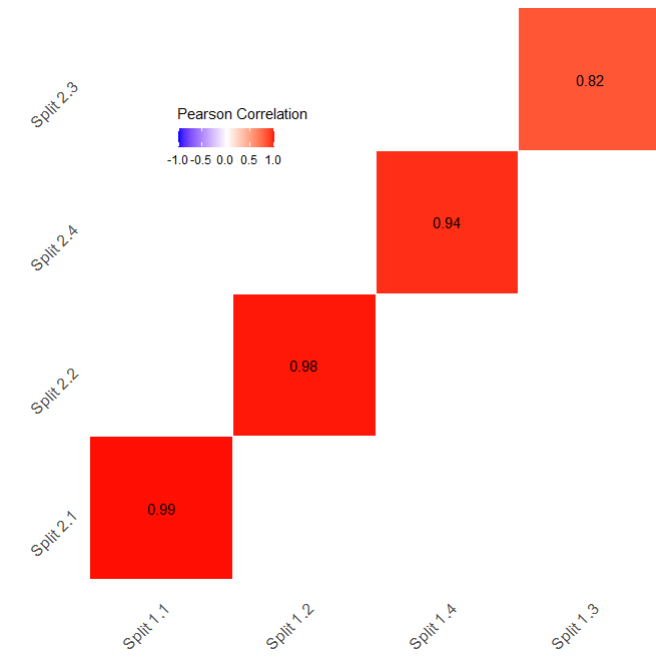

Functional Connectivity Subtypes

**Considering re-running this using the non age regressed correlations and splitting sample into bins.

Split 1

Split 2

Next Steps:

- Bootstrapped Models
- Including covariates: SES, IQ, Symptomology
- Looking at Diagnosis discounting profiles within Subtypes?
- Adding Release 8 functional connectivity data?
- Bin FC for Subtyping?
- Do we stay with the Splits for the CBCL Subtypes or run the entire data bootstrapped?

Missing from Slides:

- SES Differences
- Symptomology Differences
- More FC Results
